OJT Activity Summary Documentation

Overview

As part of my On-the-Job Training (OJT) in the IT Department, I was exposed to various technical and administrative support activities that contribute to the daily operations of the organization. This documentation serves as a consolidated summary of the procedures, systems, and responsibilities that I learned and observed throughout my training period. The activities covered in this guide involve user account administration, hardware and software deployment, access management, system maintenance, troubleshooting, and employee support services.

During my internship, I gained hands-on experience in assisting users with account-related concerns such as password resets and account unlock requests, configuring digital signatures for document approvals, managing printer connectivity issues, and supporting access control systems for doors, turnstiles, and canteen services. These tasks demonstrated the importance of maintaining secure and efficient access to company resources while ensuring business continuity.

I also learned the processes involved in workstation lifecycle management, including laptop and desktop reimaging, disk wiping, deployment of new devices, and configuration of company-issued mobile phones. Through these activities, I became familiar with standard IT deployment practices, operating system installations, asset preparation, and device enrollment procedures used within the organization.

Additionally, the training provided exposure to enterprise systems and administrative tools such as remote management platforms, account management systems, device deployment solutions, authentication services, and collaboration platforms. Understanding how these systems interact allowed me to appreciate the role of IT in supporting employees, maintaining security standards, and ensuring smooth operational workflows across departments.

This document was prepared to serve as a reference for the activities I performed, assisted with, or observed during my internship. It reflects the standard procedures followed by the IT Department and highlights the knowledge and practical skills that I acquired throughout the training program. For security and confidentiality purposes, all sensitive information, including usernames, passwords, server credentials, and other privileged access details, has been omitted or generalized. Overall, my internship experience provided valuable exposure to real-world IT operations, strengthened my technical troubleshooting skills, improved my understanding of enterprise support processes, and enhanced my ability to work in a professional corporate environment while adhering to established security and operational standards.

OJT Activity guidelines

I. User Account Management

Account Unlocking

Used when a user is locked out after multiple failed login attempts.

General Process

1. Access the account management system.
2. Search for the user's account.
3. Unlock the account.
4. Notify the user that access has been restored.

Password Reset

Used when users request password changes.

General Process

1. Access the account management system.
2. Locate the user account.
3. Initiate password reset.
4. Enter the user's preferred password.
5. Apply changes and confirm successful update.

II. Electronic Signature (E-Sign) Setup

Purpose

Enable users to digitally sign PDF documents.

Activities

1. Access the company E-Sign repository.
2. Open the required PDF document.
3. Create a digital signature profile.
4. Configure user details such as name, email, and country.
5. Import the signature image.
6. Apply digital certificate settings.
7. Save and use the signature on PDF documents.

III. Printer Setup and Configuration

Purpose

Connect users to company printers and configure printing access.

Activities

1. Open printer settings.
2. Connect to the company print server.
3. Select the required printer.
4. Configure accounting or authentication settings.
5. Register the user in the printer management portal if required.
6. Verify successful printing functionality.

IV. Food Allowance Management

Purpose

Manage employee canteen allowance allocations.

Activities

1. Access the food allowance management system.
2. Search for employee records.
3. Add new employees.
4. Scan employee identification cards.
5. Enter employee information.
6. Calculate allowance based on working days.
7. Apply corresponding load amount.
8. Update or edit records when needed.

V. Door Access Management

Purpose

Grant or modify employee building access permissions.

Activities

1. Access the door access management platform.
2. Create or search employee records.
3. Enter employee information.
4. Assign access rights and locations.
5. Scan or register employee cards.
6. Save and apply permissions.
7. Test access validation.

VI. BitLocker Recovery Assistance

Purpose

Assist users with encrypted device recovery.

Activities

1. Access the BitLocker recovery portal.
2. Obtain the recovery key reference from the user or support ticket.
3. Search for the recovery key.
4. Retrieve the corresponding recovery information.
5. Provide the recovery key to the user through approved channels.

VII. SAP User Loading and POS Maintenance

SAP Loading

1. Connect to the designated remote server.
2. Access the POS application.
3. Perform employee maintenance activities.
4. Add new employee records.
5. Update employee information when required.

POS User Management

1. Access the POS management system.
2. Add, modify, or remove employee entries.
3. Verify synchronization of employee information.

VIII. Browser Troubleshooting

Purpose

Resolve website or application loading issues.

Activities

1. Open browser settings.
2. Access browsing history.
3. Clear cache and cookies.
4. Restart the browser.
5. Restart the workstation if necessary.
6. Confirm issue resolution.

IX. Laptop Reimaging

Purpose

Deploy a clean operating system image on laptops.

Activities

1. Connect the laptop to the network.
2. Access the deployment management console.
3. Configure BIOS/boot settings.
4. Enable network boot.
5. Locate the device in the deployment console.
6. Configure device properties.
7. Assign operating system deployment settings.
8. Rename the device according to standards.
9. Activate deployment.
10. Initiate operating system reinstallation.

X. Desktop Reimaging

Purpose

Reinstall operating systems on desktop computers.

Activities

1. Connect peripherals and boot media.
2. Access boot options.
3. Launch the deployment environment.
4. Select device reinstallation.
5. Apply deployment settings.
6. Wait for imaging completion.
7. Validate successful operating system installation.

XI. Disk Wiping

Purpose

Securely erase storage devices before reuse or disposal.

Activities

1. Boot the target device.
2. Open the disk management utility.
3. Select the appropriate storage drive.
4. Execute disk wipe operation.
5. Verify successful completion.

XII. New Laptop Setup

Purpose

Prepare newly deployed laptops for end users.

Activities

1. Configure network connectivity.
2. Register device in the deployment environment.
3. Configure workstation properties.
4. Assign operating system and deployment policies.
5. Rename according to company standards.
6. Complete operating system deployment.
7. Validate device functionality.

XIII. Mobile Device Setup (Kaizen Phone)

Purpose

Enroll corporate mobile devices for employee use.

Activities

1. Register the device on the corporate network.
2. Install required applications.
3. Configure Microsoft Authenticator.
4. Register the device in Company Portal.
5. Complete user login and enrollment.
6. Validate access to corporate services such as Teams and Outlook.

XIV. Office Folder Access Configuration

Purpose

Provide users with access to shared network resources.

Activities

1. Obtain the user's computer name.
2. Access Active Directory or group management tools.
3. Search for the designated access group.
4. Add the user's computer account.
5. Apply changes and verify access.

XV. Turnstile Time Synchronization (Weekly Maintenance)

Purpose

Maintain accurate time synchronization for turnstile devices.

Activities

1. Access the Turnstile Management platform.
2. Select the appropriate device.
3. Open configuration settings.
4. Access time settings.
5. Execute manual synchronization.
6. Verify successful completion.

XVI. Employee Clearance Processing

Purpose

Remove access privileges when employees separate from the company.

Activities

1. Access the terminal server and related management systems.
2. Remove employee records from door access management.
3. Remove employee records from food allowance management.
4. Verify that all physical access and allowance privileges have been revoked.
5. Ensure required supervisor approvals are present before processing.

Major Systems and Platforms Used

The guidelines reference several enterprise platforms, including:

- Remote Desktop Services
- Active Directory / Account Management
- Desktop and Server Management (DSM)
- BitLocker Recovery Portal
- Printer Management Systems
- Microsoft 365 Administration
- Identity and Access Management (IAM)
- Company Portal
- Microsoft Authenticator
- POS Management Systems
- Door Access Management Systems
- Turnstile and Attendance Systems
- SharePoint Resources
- ServiceNow Ticketing System

Security Note

All usernames, passwords, administrator accounts, server credentials, recovery keys, and other sensitive information found in the source document have been intentionally omitted or generalized (e.g., "administrator account," "service account," or "recovery password") in this summary to maintain security and confidentiality.

Daily Activities Report

June 23, 2026 – Day 01

This day marked the beginning of our On-the-Job Training (OJT) journey at ZAMA. Upon our arrival, the Human Resources Department warmly welcomed us and guided us to the IT Department. We were introduced to the personnel who would be directly supervising and mentoring us throughout our training, namely Sir John Vincent Estrallado and Sir Christopher Arellano.

Throughout the day, Sir Vincent provided us with a comprehensive orientation regarding the OJT guidelines, the types of technical issues we might encounter, and the appropriate methods for resolving them. We were also introduced to the various machines and equipment that we would potentially interact with during our training.

In addition, we were given a tour of the different departments within the company, as the IT Department provides computer and network support to most departments in ZAMA. Sir Vincent also explained the purpose of our training, our expected responsibilities, and the significant role of the IT Department in ensuring the company's daily operations run efficiently.

Overall, the orientation gave us a clear understanding of our tasks, responsibilities, and the importance of our work, helping us feel more prepared and motivated for our OJT experience at ZAMA.

June 24, 2026 – Day 02

On this day, we began performing our first actual tasks as interns in the IT Department. The department has a well-organized system for receiving and managing IT-related concerns from employees, which helped us understand the workflow and the process of addressing technical issues efficiently.

As interns, we were assigned tasks that were suitable for our skill level, allowing us to gradually gain hands-on experience. Although the tasks were relatively simple, they were still challenging and required careful attention to detail. One of the issues we handled involved troubleshooting computer connectivity problems related to Ethernet connections and switch configurations.

Through this task, we were able to apply the knowledge and skills we learned from our Cisco networking courses, particularly in diagnosing network connectivity issues. The troubleshooting process took some time because it was important to accurately identify the correct physical port and network switch connected to the affected Ethernet cable. This ensured that we could resolve the issue without disrupting the work of other employees who relied on the network.

Overall, this experience provided us with valuable practical exposure and allowed us to apply our classroom learning to real-world IT support situations. It also helped us develop our problem-solving skills and understand the importance of accuracy and responsibility in an IT work environment.

June 25, 2026 – Day 03

On this day, we had the opportunity to learn from another member of the IT Department during our free time, as there were no active employee concerns that required our attention. We were

guided by Sir Miko Pangilinan, whose role involves system design and the development of various web-based systems used by ZAMA.

Sir Miko demonstrated the nature of his work and explained the overall workflow involved in designing and developing web applications. He introduced us to different approaches for creating well-structured and organized front-end code and explained how it interacts with the database and back-end systems to ensure smooth functionality.

Throughout the discussion, he emphasized the importance of logical code structure, maintainability, and efficient system design in web development. He also shared valuable insights into industry practices and the technologies commonly used in developing modern web applications.

Furthermore, Sir Miko expressed his willingness to mentor us and teach us more about web development from time to time throughout our internship. He highlighted the growing importance of web development in today's technology-driven world and encouraged us to continuously enhance our skills in this field.

Overall, this session provided us with valuable knowledge and a deeper understanding of system design and web development, broadening our perspective on the different roles and responsibilities within the IT Department.

June 29, 2026 – Day 04

During this day of our on-the-job training, we assisted the IT department in several important tasks related to asset management, technical support, and employee onboarding. These activities provided us with valuable hands-on experience and a better understanding of the daily responsibilities of an IT team within an organization.

One of our primary tasks was helping with the inventory of company laptops that had been distributed to employees. We assisted in reviewing and verifying asset records to ensure that all issued devices were properly documented and accounted for. In addition, we helped identify laptops that were no longer in use and were scheduled for disposal. This activity highlighted the importance of maintaining accurate inventory records and ensuring that company assets are properly tracked throughout their lifecycle.

Another responsibility we handled was assisting with various IT-related concerns from users. We helped address technical issues by performing basic troubleshooting and supporting the IT team in resolving reported problems. Through this activity, we gained practical exposure to IT support processes and learned the importance of providing timely assistance to ensure minimal disruption to daily operations.

We also had the opportunity to participate in the setting up of a new ID registration system for incoming employees. This involved assisting in the installation and preparation of the necessary equipment and ensuring that the system was functioning properly. The activity gave us hands-on experience with hardware setup and system configuration, both of which are essential skills in IT operations. Furthermore, it emphasized the role of technology in supporting employee onboarding and organizational security.

Overall, the day's activities were both productive and educational. By assisting with laptop inventory management, resolving IT concerns, and setting up the ID registration system, we were able to contribute to the department's operations while enhancing our technical knowledge and practical skills. These experiences provided valuable insights into the importance of effective IT

asset management, user support, and technology deployment within a professional work environment.

June 30, 2026 – Day 05

On this day, our department had a scheduled activity involving the IDM (Identity Management) server racks. As interns, we were assigned to assist and accompany the contractors responsible for cleaning the air-conditioning units that help maintain the proper operating temperature of the IDM server racks.

Our responsibilities included guiding the contractors to the designated locations, monitoring the server racks during the maintenance process, and ensuring that no issues or disruptions occurred while the air-conditioning units were being cleaned. This activity also provided us with a valuable learning opportunity, as we were able to observe and understand the importance of regular maintenance in maintaining the reliability and performance of critical IT infrastructure.

In addition to this assignment, we also handled several minor IT-related concerns and support requests from employees throughout the day. These tasks allowed us to continue developing our technical and customer service skills while supporting the daily operations of the company.

The final task assigned to us for the day was the registration of an ID card for a newly hired employee. This process was essential for integrating the employee into the company's Identity Management System, which enables attendance logging, access to authorized doors and company facilities, and the use of canteen meal allowances. Completing this registration ensured that the employee could fully utilize the services and privileges required for their daily work activities.

Overall, this day provided us with valuable exposure to both infrastructure maintenance activities and routine IT support operations, helping us gain a better understanding of the diverse responsibilities of an IT department.

July 01, 2026 – Day 06

On this day, we attended an orientation program for OJTs in the morning. The orientation was conducted to familiarize us with the company's norms, policies, safety standards, and the procedures that would guide us throughout our internship. Although we had already started our OJT a week earlier, we understood that the orientation was organized to accommodate the new batch of interns who were beginning their training on that day.

The orientation was both informative and engaging, providing valuable insights into the company's culture and workplace expectations. Through various discussions and activities, we gained a better understanding of our responsibilities as interns and the importance of maintaining professionalism and safety in the workplace.

After the orientation, we resumed the task we had started the previous Monday, which involved updating and verifying the inventory of laptops distributed to employees and newly assigned OJTs from different departments. This activity helped us become more familiar with asset management procedures and the importance of maintaining accurate equipment records.

In the afternoon, we assisted in resolving several employee concerns related to printer access and connectivity. These support requests allowed us to further develop our troubleshooting and customer service skills while helping end users.

Later in the day, we had the opportunity to attend a brief learning session with Sir Marco Ramos. During the session, Sir Marco introduced himself as an experienced IT professional who had

supported multiple companies throughout his career. He currently serves as a team leader responsible for consulting and supporting system improvement initiatives for STIHL, the parent company of ZAMA.

Sir Marco shared his experiences in IT operations, consulting, and system support. He explained how he collaborates with organizations to improve business processes, optimize systems, and provide effective technical solutions. His insights gave us a broader perspective on the different career paths available in the IT industry and the skills required to succeed in consulting and leadership roles.

We learned a great deal from his experiences and advice, which encouraged us to continuously improve our technical knowledge, professional skills, and work ethic. The session was highly inspiring and provided valuable guidance for our personal and professional development.

After the session, we continued addressing various IT-related concerns and service requests from employees, applying the knowledge and skills we had gained throughout the day. Overall, the experience was both productive and educational, contributing significantly to our growth as IT interns.

July 02, 2026 - Day 07

On this day, we started by continuing the laptop inventory management task that we had been working on previously. As part of the process, we transferred the non-functional laptops to the old IT room for proper storage and documentation. These units were separated from working devices so that they could be evaluated, repaired, or disposed of appropriately in the future.

After completing this task, we attended to a request involving laptops that were to be issued to new OJTs assigned to different departments. Under the supervision of Sir Vince, we helped prepare the laptops by checking their condition, configuring necessary settings, and ensuring that they were ready for deployment. By assisting with these preparations, we helped streamline the process, allowing Sir Vince to focus on higher-level tasks such as approvals and documentation.

Later, we received a request from one of the departments for a new straight-through Ethernet cable. Since we had already learned how to create Ethernet cables through our Cisco networking courses, Sir Vince asked us to handle the task. We successfully assembled and tested the cable, applying the knowledge and skills we had acquired in school. This experience was particularly rewarding because it demonstrated how the concepts and practical skills we learned in the classroom could be directly applied in a real-world work environment.

Following this, we responded to a network connectivity issue reported by the Security Office. One of their computers was experiencing connection problems, and we assisted in troubleshooting and resolving the issue to restore its network access.

Before lunch, we processed several requests from the Human Resources Department regarding the ID registration of newly deployed OJTs. This task was important to ensure that the interns could properly access the company's attendance system, facilities, and other services linked to their identification cards.

In the afternoon, we received additional requests from the Security Department. These included resetting a turnstile access device and deleting outdated user accounts from the system. We assisted in carrying out these tasks to maintain the accuracy and security of the company's access management system.

Overall, the day was productive and provided us with valuable hands-on experience in asset management, hardware preparation, network troubleshooting, cable installation, and access control administration. These activities further enhanced our technical skills and allowed us to contribute meaningfully to the daily operations of the IT Department.

July 03, 2026 – Day 08

On this day, we accomplished a variety of tasks and gained valuable hands-on experience in different areas of IT operations. We started the morning with a brief discussion of the planned activities and priorities for the day, which helped us understand our responsibilities and organize our tasks efficiently.

Following the meeting, together with Sir Vince and Sir Chris, we received a shipment of newly ordered Cisco switches. We assisted in transporting the equipment to the IT storage room to ensure its security and proper safekeeping. These switches were prepared for future configuration and deployment, which was scheduled for the following week.

Afterward, we worked on reimaging several laptops that were requested by employees who needed replacement or newly assigned devices. This task involved reinstalling the operating system and preparing the laptops with the necessary configurations and software required for company use.

Later in the day, Sir Vince asked us to follow up on several concerns raised by employees from the Quality Department. These issues involved internet traffic and connectivity problems, as well as computers experiencing malfunctions with critical applications. We assisted in investigating and addressing these concerns to ensure minimal disruption to employee productivity.

In the afternoon, we handled several minor IT support requests, including printer connectivity issues and additional configuration tasks for the laptops that had been recently reimaged. These activities allowed us to further develop our troubleshooting and technical support skills.

We also processed requests related to employee offboarding. Specifically, we assisted in removing resigned employees from the canteen Point-of-Sale (POS) system and door access control system. Completing these tasks was necessary to support the employee clearance process and ensure that access privileges were properly revoked.

Before the end of the day, we continued setting up and configuring the newly reimaged laptops to ensure they were fully prepared for deployment to their intended users.

Overall, the day was productive and provided us with valuable experience in hardware management, device deployment, technical support, user account administration, and access control management. These tasks further enhanced our technical knowledge and allowed us to contribute effectively to the daily operations of the IT Department.

July 06, 2026 – Day 09

On this day, we continued working on tasks that had been carried over from the previous week. In the morning, we reset the turnstile system used by the Security Department due to issues with its date and time settings, which were affecting its normal operation. Ensuring that the correct date and time were configured was important for maintaining accurate access and attendance records. On the same day, the laptop that we had prepared and configured was scheduled for deployment to an employee. As part of the replacement process, we retrieved the desktop computer that was being replaced. This step was necessary to ensure that company assets were properly tracked and

updated in the inventory system, allowing the IT Department to maintain accurate records of device assignments.

After retrieving the desktop computer, we evaluated the possibility of using it to replace a faulty PC located in the Production Department. The existing production computer was experiencing issues with several important applications, which affected its functionality. Before proceeding with the replacement, we carefully inspected and tested the retrieved desktop unit to ensure that its hardware, particularly the CPU and other critical components, was functioning properly and would not introduce additional problems.

The inspection and assessment process took most of the day, as we needed to verify that the replacement computer was reliable and suitable for use in the production environment. Since the faulty computer was still operational and was not significantly disrupting production activities, the actual replacement was postponed and scheduled for the following day.

Later in the day, we handled a network connectivity issue involving an intern's desktop computer. After troubleshooting the problem, we found that the Ethernet port connected to the workstation had not been properly activated on the network switch. We corrected the configuration and restored the computer's network connection, allowing the user to continue their work without further interruption.

Overall, the day's activities provided valuable experience in asset management, hardware inspection, system maintenance, and network troubleshooting. These tasks reinforced the importance of careful evaluation, proper documentation, and effective problem-solving in supporting the organization's IT infrastructure.

July 07, 2026 - Day 10

On this day, we continued working on the activities that had been carried over from the previous day, as well as participating in the scheduled learning sessions conducted by different teams within the IT Department.

In the morning, we completed the deployment of the desktop computer intended to replace the faulty PC in the Production Department. Our task involved delivering, setting up, and configuring the replacement unit to ensure that it was ready for use. After the installation, we monitored its performance and verified whether the issues experienced on the previous computer persisted. This activity helped us understand the importance of proper hardware replacement and testing in maintaining the productivity of end users.

Since both we intern and Sir Paul, the Network Specialist from the Network Team, had available time during the morning, he took the opportunity to teach us about the actual setup and configuration of Cisco network switches. To provide a hands-on learning experience, we used the newly received Cisco switches that had recently been added to the IT inventory.

During the session, Sir Paul explained the fundamentals of switch configuration and demonstrated how network switches are prepared before deployment. He showed us the proper assembly and connection procedures, as well as the basic configurations required for network operation. We were also introduced to PuTTY, a terminal emulation software commonly used to access and configure network devices through a console connection. Through this demonstration, we gained a deeper understanding of how networking concepts learned in school are applied in a real-world enterprise environment.

Later in the day, we attended several employee concerns involving printer connectivity and network connection issues. We assisted in troubleshooting and resolving these problems to ensure that employees could continue their work without interruption.

During our available time, we also studied learning materials assigned to us by Sir Phomer. The modules focused on automation concepts and technologies, allowing us to expand our knowledge of modern IT practices and prepare for future tasks involving automated processes and system management.

Overall, the day was highly productive and educational. It provided us with valuable exposure to hardware deployment, network infrastructure, technical support, and automation concepts. Through hands-on activities and mentorship from experienced IT professionals, we continued to enhance our technical skills and gain a deeper understanding of the various responsibilities within the IT Department.

July 08, 2026 - Day 11

On this day, we had the opportunity to learn and experience several new aspects of IT operations within the department. We started the morning by performing our routine turnstile reset procedure. Due to an existing physical issue with the device, the turnstile occasionally experiences software malfunctions. While awaiting a permanent solution to the hardware problem, the IT Department performs daily resets to ensure that the system continues to function properly and that employee access remains uninterrupted.

After completing this task, Sir Mervin, who is responsible for managing and maintaining the company's servers, invited us to a short but highly informative lecture about his profession and responsibilities within the IT Department. During the session, he shared valuable insights into server administration, including how server-related issues are handled, monitored, and resolved. Beyond the technical aspects of his work, Sir Mervin also shared important career advice and life lessons. He emphasized the importance of taking one's first job seriously, continuously learning from every experience, and building strong professional relationships with colleagues and mentors. His discussion provided us with both technical knowledge and valuable guidance for our future careers.

Following the lecture, we spent some time continuing our study of the Power Automate learning modules that had been assigned to us. These materials helped us gain a better understanding of workflow automation and how modern organizations use automated processes to improve efficiency and productivity.

Later in the day, representatives from Globe Telecom arrived at the company to perform network-related work in the server room. We were assigned by our supervisors to assist and guide the visitors during their activities. During their initial visit in the morning, the Globe technicians inspected and assessed the network equipment and server connections that required modification. After completing their inspection, they temporarily left to continue their reporting and coordination activities in FPIP.

In the afternoon, the Globe Telecom team returned to continue their work. Their tasks included modifying network configurations, updating IP address settings, and installing fiber optic connections to support improved network performance and communication services. While assisting them, we took the opportunity to observe their procedures and learn more about fiber optic installation, network infrastructure, and server connectivity.

Throughout the activity, Sir Mervin further explained the purpose of the changes being implemented and provided additional insights into server management and network operations. Observing both the Globe technicians and Sir Mervin allowed us to connect theoretical concepts with real-world applications, giving us a clearer understanding of how enterprise networks and server environments are maintained.

Overall, this was a particularly memorable and educational day. We not only gained valuable knowledge about server administration and professional development through Sir Mervin's lecture but also had the rare opportunity to witness and learn from actual network and fiber optic installation activities. The experience deepened our understanding of IT infrastructure and provided practical exposure to technologies and procedures that are critical in modern enterprise environments.

July 09, 2026 - Day 12

On this day, we gained valuable hands-on experience in various areas of IT support and hardware maintenance within the IT Department. As part of our daily routine, we started the morning by resetting the turnstile system to address recurring software issues caused by an existing hardware problem. This routine maintenance helped ensure that the access control system remained operational while awaiting a permanent repair.

After completing the turnstile reset, we attended to several employee concerns involving defective computer peripherals, including malfunctioning keyboards and mice that required replacement. By assisting with these requests, we contributed to maintaining employee productivity and gained experience in identifying and replacing faulty hardware components.

Later in the morning, we received a request to prepare a laptop for deployment to an employee. Upon inspection, we found that the available laptop required hardware upgrades and adjustments before it could be issued. To address this, we carefully removed compatible RAM modules from defective laptops of the same model and installed them in the replacement unit. This activity introduced us to practical hardware servicing and component recycling, allowing us to gain hands-on experience with physical computer upgrades—an experience that differed significantly from the laboratory exercises we had performed in school.

After completing the hardware modifications, we proceeded to reimage the laptop by installing a fresh operating system and ensuring that it met the company's deployment standards. This process helped guarantee that the device would operate efficiently and provide reliable experience for the end user.

While waiting for the reimaging process to finish, we continued studying the Power Automate training modules assigned to us. These learning materials helped us further understand workflow automation concepts and prepared us for the assessment that had been scheduled for the afternoon.

In the afternoon, we completed the remaining modules and took the Power Automate examination. After successfully finishing the assessment, we sought approval from Sir Kristof, who had planned for us to begin working on automation projects the following week. He emphasized the importance of gaining practical experience with Power Automate and encouraged us to apply what we had learned through actual automation projects.

Later in the day, we assisted visitors who arrived to conduct a CCTV installation project for the workshop areas within ZAMA. Under the guidance of our supervisors, we helped map the

proposed CCTV locations and reviewed the installation layout to ensure proper camera coverage. This activity allowed us to observe another aspect of IT infrastructure and security systems, giving us a better understanding of how surveillance technologies are planned and implemented in an industrial environment.

Overall, the day was highly productive and educational. We gained practical experience in hardware maintenance, device deployment, workflow automation, and security infrastructure planning. These activities not only strengthened our technical skills but also provided us with broader exposure to the diverse responsibilities and technologies managed by the IT Department.

July 13, 2026 - Day 13

On this day, we continued performing our regular responsibilities as IT Support interns and gained further experience in handling common technical issues within the organization. We started the morning by resetting the turnstile system in the Security Department, which has become part of our daily routine due to an ongoing hardware issue that has yet to be permanently resolved. This procedure helps ensure that the access control system remains operational and continues to function properly throughout the day.

After completing the turnstile maintenance, we focused on preparing several laptop units for future deployment to employees. Some of the available devices required hardware upgrades and adjustments before they could be issued. We assisted in upgrading and preparing these laptops to ensure that they meet the company's standards for performance and usability.

During the day, we also assisted a team of PLDT Telecom personnel who visited the facility to conduct a site survey for a planned underground network line installation. As interns, we helped guide the visitors to the locations relevant to their project and assisted them in navigating the area. The purpose of their visit was to assess the site conditions and plan the installation work that would be carried out on the following day. While accompanying them, they shared their proposed layout, installation process, and the considerations involved in deploying underground communication lines. This provided us with valuable insights into telecommunications infrastructure planning and allowed us to observe how large-scale network projects are carefully prepared before their actual implementation.

Once the hardware upgrades were completed, we proceeded with reimaging several devices. This process involved reinstalling the operating system and configuring the devices with the necessary settings and applications required for company use. Reimaging took a considerable amount of time, as each device needed to be carefully prepared and tested before deployment.

Throughout the day, we also continued assisting employees with various IT-related concerns and support requests. Among the most frequent issues we encountered were problems involving Microsoft Teams and user accounts that had become locked due to multiple unsuccessful login attempts. We helped investigate these concerns and assisted users in restoring access to their accounts and applications so they could continue their work without significant interruptions.

In addition, we participated in discussions regarding a planned DSM (Desktop and Server Management) update that may be implemented in the future. This update is being considered to address several recurring issues reported by users, including Microsoft Teams not being installed on some devices, application launch failures, and problems caused by outdated software versions. Through these discussions, we learned about the importance of system maintenance, software updates, and proactive IT management in ensuring a stable and efficient computing environment.

Overall, the day was both productive and educational. Aside from gaining experience in device preparation, operating system deployment, and user support, we were also exposed to the planning phase of telecommunications infrastructure projects through our interaction with the PLDT team. These activities enhanced our technical troubleshooting skills, broadened our understanding of enterprise IT and network operations, and provided valuable insight into the coordination required for both internal IT services and external telecommunications projects.

July 14, 2026 - Day 14

In the morning, we worked on reimaging several laptops that were scheduled for distribution to employees. This process involved preparing the devices with the required operating system, configurations, and software to ensure that they were ready for deployment. We also addressed several IT-related concerns from employees, including account unlock requests caused by multiple unsuccessful login attempts. By assisting with these issues, we helped restore user access and minimize disruptions to their work.

Later in the day, the PLDT personnel arrived to begin preparations for the installation of a new telecommunications line within the ZAMA facility. As interns, we were assigned to assist and guide them to the locations where the underground telecommunications infrastructure would be installed. We helped coordinate access to the work areas and accompanied them throughout the site while they carried out their initial setup activities.

This experience gave us the opportunity to observe how telecommunications providers implement network infrastructure projects in a corporate environment. We were able to see firsthand how underground communication lines are planned and installed, which broadened our understanding of network connectivity beyond the typical responsibilities of an IT support team.

As the installation work progressed, the PLDT personnel explained their plans and project timeline for the coming days. They informed us that the installation process would likely take approximately one week to complete, as it involved extending and integrating the telecommunications line into the company's server and network infrastructure. Listening to their explanations allowed us to gain insight into the planning, coordination, and technical considerations required for large-scale network deployments.

After assisting the PLDT team, we returned to the IT office and continued handling employee support requests and other routine tasks. We also briefed our IT supervisors on the progress of the PLDT project and shared the information provided regarding the installation schedule and planned activities.

Overall, the day was both productive and educational. In addition to continuing our responsibilities in device deployment and user support, we gained valuable exposure to telecommunications infrastructure installation and project coordination. Observing the PLDT technicians and learning about their implementation process helped expand our understanding of real-world networking and the collaboration required between IT departments and external service providers.

July 15, 2026 - Day 15

On this day, we spent a significant portion of our time performing IT-related tasks outside the office, which provided us with valuable hands-on experience in network support and infrastructure management. We started the morning by visiting the Quality Assurance (QA) Office to address network connectivity issues related to recent changes in their workplace setup.

To resolve the concern, we assisted in preparing and extending network connections by working with Ethernet cables and RJ45 connectors. We also verified that the network ports intended for use were properly activated and connected to the appropriate switch within their office. This task allowed us to apply our networking knowledge and gain additional experience in troubleshooting and physical network installations.

After completing the work in the QA Office, we returned to the IT office to attend a brief discussion regarding our ongoing responsibilities and the management of support tickets that had been assigned to us. During this session, we reviewed completed tasks, discussed pending concerns, and received guidance on how to maintain consistency and efficiency in handling employee requests.

Later in the morning, the PLDT personnel arrived to continue the telecommunications line installation project. As we had done during the previous days, we guided and assisted them while they worked within the company premises. Their activities involved extending the telecommunications line from inside the facility toward the external connection point that would eventually link to the FPIP management network. Since the work outside the company premises was beyond our area of responsibility and authorization, we were only able to assist with the installation activities conducted within ZAMA.

Before leaving for the day, the PLDT personnel provided us with an update regarding their planned activities for the following day. They explained the next stages of the installation process, allowing us to relay this information to the IT Department and keep our supervisors informed about the project's progress.

In the afternoon, we were assigned a new task involving the mapping and documentation of the server room. This activity was conducted in preparation for future developments and infrastructure improvements planned by the company. As part of the task, we carefully inspected and documented the various networking and server equipment installed within the server room. We identified the equipment currently in operation, recorded its purpose and status, and observed how the devices were organized and interconnected.

For us, this was a valuable learning opportunity because it provided a closer look at the physical infrastructure that supports the company's IT operations. Through this activity, we gained a better understanding of how enterprise networking equipment is managed, maintained, and organized to ensure reliability and efficiency.

After completing the documentation process, we prepared a summary of our findings and reported the details to our IT supervisors for review and future reference. Following a short break, we spent the remainder of the day assisting with several support tickets and employee concerns before concluding our work.

Overall, the day was highly productive and educational. We gained practical experience in network troubleshooting, telecommunications infrastructure support, server room documentation, and IT service management. These activities broadened our understanding of enterprise IT operations and allowed us to further develop both our technical skills and professional responsibilities as IT interns.

July 16, 2026 - Day 16

On this day, we spent a significant amount of time outside the office assisting with various IT support and infrastructure-related activities. The day provided us with valuable hands-on

experience in troubleshooting hardware, maintaining networked devices, and supporting telecommunications projects within the company.

In the morning, we addressed several employee concerns involving computer and printer-related issues. Our first task was to assist with a printer problem in one of the new buildings. Under the guidance of Sir Vince, we helped configure the printer and learned different troubleshooting techniques used to resolve printing issues. He explained the importance of maintaining reliable printer services, especially in a manufacturing environment where documentation and production-related reports are essential to daily operations. This made the printer issue a high-priority concern that needed immediate attention.

After resolving the printer issue, we proceeded to another production area to address a malfunctioning desktop computer. Upon inspection, we discovered that the computer was experiencing memory (RAM) issues, which were affecting its performance. We assisted in troubleshooting the problem and were eventually able to restore the computer to normal operation. The workstation also had a minor network connectivity issue, which we successfully resolved before moving on to our next assignment.

Later in the morning, the PLDT personnel arrived to continue the installation and set-up of their telecommunications line within the company premises. As with the previous days, we were assigned to assist and guide them during their work. This time, we were accompanied by our supervisor, Sir Chris, as well as our Department Head, Sir Phomer, who briefly checked on the project and ensured that everything was progressing smoothly.

Before noon, the PLDT technicians informed us that they would continue their work after lunch and provided an update regarding the progress of the installation. We relayed the information to our supervisors and then proceeded with our lunch break.

In the afternoon, we resumed assisting the PLDT personnel as they continued the implementation of the telecommunications line. Due to the sensitive locations involved, particularly near the server room and restricted areas, we coordinated with authorized ZAMA personnel who helped facilitate access and ensure compliance with company security procedures.

As the installation activities progressed, the technicians explained that the next day would involve the final stages of the project, including the setup and testing of the fiber-optic connection. They discussed the importance of verifying signal integrity and ensuring that the connection was fully operational before the project could be completed. Listening to their explanations allowed us to gain further insight into real-world telecommunications and network infrastructure deployment.

After the PLDT team completed their activities for the day, we returned to the IT office and provided a detailed briefing to our supervisors regarding the progress of the installation project and the planned activities for the following day.

Following the briefing, we assisted with several remaining IT tasks, including organizing work assignments and resolving minor employee concerns before the end of our shift. These activities helped ensure that pending support requests were addressed and that operations continued smoothly throughout the company.

Overall, the day was highly productive and educational. We gained practical experience in printer configuration, hardware troubleshooting, network support, and telecommunications infrastructure deployment. Working alongside experienced IT professionals and external technicians allowed us to better understand the importance of coordination, technical knowledge, and communication in supporting the company's operations and maintaining a reliable IT environment.

July 17, 2026 - Day 17

On this day, we had a relatively slow but highly educational day in the IT Department. Although there were only a few support requests to handle, we were able to gain valuable knowledge and insights from our supervisors and from observing ongoing infrastructure projects within the company.

In the morning, we attended to several routine IT support tasks, including password reset requests from employees who were unable to access their accounts. These requests required us to follow the proper account management procedures to restore user access while maintaining security and compliance with company policies.

After completing these tasks, we had a considerable amount of free time while waiting for the arrival of the PLDT personnel, who were scheduled to continue their work later today. During this period, we had an insightful discussion with Sir Vince and Sir Chris. They shared valuable advice on how we could improve our work efficiency, develop good professional habits, and maximize our learning experience during our internship. They also provided guidance on improving our curriculum vitae (CV) and discussed how the skills and experience we are gaining in the workplace can contribute to our future careers in the IT industry. This conversation gave us a better understanding of the professional expectations in the field and motivated us to continue developing both our technical and interpersonal skills.

The afternoon remained relatively quiet, with very few employee concerns requiring assistance. Taking advantage of the slower workload, Sir Vince conducted a brief learning session about ServiceNow, the ticketing system used by the department for managing and tracking IT support requests. He explained how support tickets are processed, monitored, and updated after a task has been completed. Through this discussion, we gained a clearer understanding of the importance of proper documentation, ticket management, and communication in maintaining efficient IT support operations.

During the final hour of the day, the visitors we had been expecting finally arrived. These included the technicians responsible for the upcoming CCTV installation project as well as the PLDT personnel, who were completing the final activities scheduled for the week. The PLDT team focused on installing and configuring the fiber-optic cabling connected to the backup server room, which forms part of the company's telecommunications infrastructure improvement project.

Observing this activity allowed us to gain additional exposure to fiber-optic networking technologies and understand how telecommunications providers integrate their services into an organization's network environment. It also gave us the opportunity to witness the final stages of a network infrastructure project and appreciate the planning and coordination required to ensure a successful implementation.

Overall, despite having fewer support requests than usual, the day was highly beneficial to our learning and professional development. Through discussions with our supervisors, training on ServiceNow, and exposure to ongoing telecommunications and security infrastructure projects, we gained valuable knowledge that expanded both our technical understanding and our awareness of professional IT practices.

July 20, 2027 - Day 18

On this day, we had a meaningful and productive Monday as we continued working on several ongoing tasks and projects within the IT Department. Although the day was relatively calm, it provided us with valuable learning opportunities and further exposure to the company's IT infrastructure.

In the morning, we handled a few routine tasks related to the preparation of employee devices. These included booting up and performing initial checks on laptops and company-issued mobile phones that were scheduled for distribution to employees. We ensured that the devices were functioning properly and ready for deployment according to company standards.

Since there were only a few support tickets and employee concerns during the morning, we continued our ongoing task of documenting and mapping the company's server rooms. Previously, we had completed the documentation of Server Room 1, and we had planned to map Server Room 2 on a day when our workload was lighter. This day provided the perfect opportunity to continue that activity.

We spent most of the morning carefully inspecting and documenting the equipment located in Server Room 2. During this process, we observed and identified various types of servers, network switches, routers, and other critical networking equipment that support the company's operations. This activity gave us valuable exposure to enterprise-level IT infrastructure and allowed us to better understand how different networking and server components are organized, managed, and interconnected. Being able to see and interact with these devices firsthand was especially beneficial, as it reinforced many of the concepts we had learned academically and provided a clearer understanding of their real-world applications.

In the afternoon, we received a request to replace an employee's monitor with a newer unit due to the age and condition of the existing device. We assisted in removing the old monitor, setting up the replacement, and ensuring that the display was functioning correctly. This task helped us gain additional experience in workstation maintenance and hardware deployment.

After completing the monitor replacement, we participated in a brief team discussion regarding the plans and priorities for the remainder of the week. This meeting was conducted to organize upcoming activities, review ongoing tasks, and help the team maintain an efficient workflow. It also gave us a better understanding of how IT departments plan and coordinate their responsibilities to ensure that support services and projects are completed effectively.

Overall, the day was both productive and educational. While the workload was relatively light, we gained significant learning opportunities through the server room mapping project and our exposure to enterprise networking equipment. Combined with our routine support activities and team planning discussions, the experience further enhanced our technical knowledge, organizational skills, and understanding of IT operations in a professional environment.

July 21, 2026 - Day 19

On this day, we had a pleasant and productive workday that, despite having a relatively light workload, provided us with another valuable learning experience. In the morning, we received only a few support tickets from employees. Most of these concerns were resolved remotely, allowing us to address issues more efficiently without the need to visit individual workstations. This helped us understand the importance of remote support tools in improving response times and productivity within the IT Department.

After resolving the morning concerns, we proceeded to double-check the documentation we had prepared for the server room mapping project. To verify the accuracy of our records, we revisited the server rooms and conducted a quick inspection of the equipment and infrastructure. During this review, we discovered a minor water leak in Server Room 1. Although the leak had not caused any damage to the equipment, we immediately reported it to Sir Vince to ensure that appropriate action could be taken before it became a larger issue.

This situation provided us with an important lesson in professional responsibility and workplace coordination. Sir Vince explained that while the issue was located within an IT facility, it was not the responsibility of the IT Department to perform building or plumbing repairs. Instead, the proper course of action was to coordinate with the appropriate personnel who are trained and authorized to handle such concerns. He then contacted the Facilities Department to assess and resolve the leak. Through this experience, we learned the importance of escalation procedures and the value of involving the right people for the right job to ensure that issues are resolved safely and efficiently.

Following the inspection, we participated in a short briefing and continued organizing the documentation related to the server room mapping project. The purpose of this project was to create an accurate inventory of the equipment inside each server room and to document important information such as power consumption, wattage requirements, and electrical load measurements. These records will support future IT infrastructure projects, particularly those related to power management and backup systems, helping ensure that critical servers remain operational during power interruptions and reducing the risk of unexpected downtime.

In the afternoon, we handled a few additional support requests, including assisting a manager with the installation of printer drivers required for their workstation. We also had the opportunity to observe and assist in the installation of Wi-Fi routers intended to improve connectivity within the employee lounge. This activity gave us additional exposure to network infrastructure deployment and allowed us to better understand how wireless networking solutions are implemented to improve user experience within the workplace.

The experience was particularly valuable because it exposed us to another aspect of IT infrastructure improvement and demonstrated how network enhancements contribute to employee productivity and convenience. Through these activities, we continued to expand our practical knowledge of IT support, network equipment, and infrastructure planning.

Before the end of the day, we attended a brief team discussion to review completed tasks, ongoing projects, and priorities for the following days. This helped ensure that everyone remained informed and aligned with the department's objectives.

Overall, the day was both educational and productive. From resolving support tickets and verifying server room documentation to learning about facility coordination and wireless network deployment, we gained valuable insights into the collaborative nature of IT operations. These experiences further developed our technical skills, problem-solving abilities, and understanding of how various departments work together to maintain a reliable and efficient IT environment.

July 22, 2026 - Day 20

On this day, we had a highly educational and insightful experience thanks to the members of the Global IT Support Team, who took the time to teach us about their respective roles and

responsibilities within the organization. The day provided us with a broader understanding of the various career paths and specialized fields available in the IT industry.

In the morning, we attended our usual briefing with the Local IT Team, where we discussed pending tasks, ongoing projects, and the work schedule for the day. After the briefing, we assisted several employees with IT-related concerns and support requests. Although there were only a few tickets to handle, we ensured that all reported issues were addressed promptly and efficiently.

The afternoon became the highlight of the day as we were given the opportunity to learn directly from several members of the Global IT Team. First, Sir Kiko, who is responsible for managing Linux-based applications and systems used within ZAMA, approached us and asked if we were available for a learning session. Since our workload was light that afternoon, we gladly accepted the opportunity.

During his discussion, Sir Kiko introduced us to the role of Linux systems within the company's operations and explained the importance of using Linux sandbox environments for application testing and development. He demonstrated how these environments provide flexibility, security, and efficiency by allowing applications and configurations to be tested without affecting production systems. Through his explanations, we gained a better understanding of how Linux supports enterprise applications and why it remains an important platform in many organizations. After Sir Kiko's session, Sir Keyvin shared insights about his role as a Database Administrator (DBA). He explained how he and his team are responsible for managing organizational data, maintaining database performance, ensuring data integrity, and controlling user access to critical information. He also discussed the importance of properly handling data and explained how databases support many of the systems and applications used throughout the company. His presentation helped us appreciate the crucial role that database management plays in business operations and decision-making.

Following Sir Keyvin's discussion, he introduced us to Ma'am April, who specializes in API (Application Programming Interface) Management. Ma'am April explained how APIs enable different systems and applications to communicate and exchange data effectively. She discussed some of the common challenges encountered in API management, including delays in data processing, system integration issues, and ensuring reliable data flow between applications. Through her explanation, we gained a deeper understanding of how interconnected modern business systems are and how important API management is in maintaining smooth and efficient operations.

Beyond sharing technical knowledge, Ma'am April also provided valuable advice regarding one of our personal development projects. She offered suggestions on how we could improve our approach, identify potential solutions, and strengthen the overall design of our project. Her guidance gave us new perspectives and ideas that we can apply to improve both our technical skills and problem-solving abilities.

By the end of the sessions, we realized how broad and diverse the field of Information Technology truly is. Each professional shared unique experiences, responsibilities, and challenges associated with their areas of expertise, exposing us to career paths that we previously knew very little about. Overall, this was one of the most educational days of our internship. Through the generosity and mentorship of the Global IT Team, we gained valuable insights into Linux administration, database management, and API integration. The knowledge, experiences, and professional advice shared

with us not only expanded our technical understanding but also inspired us to continue learning and exploring the many opportunities available within the IT industry.

July 23, 2026 - Day 21

On this day, we had a great experience interacting with employees across different departments while also gaining valuable knowledge from one of our colleagues in the Global IT Team. The day was both productive and educational, allowing us to improve our communication skills, asset management experience, and understanding of identity and access management systems.

In the morning, we attended our usual team briefing before starting the day's activities. During the meeting, we discussed the tasks that needed to be completed, especially because of the upcoming moved holiday and the department's scheduled leave on the following Monday. This helped us organize our workload and prioritize pending responsibilities.

After the briefing, we addressed several IT-related concerns from employees. These included printer access issues, user accounts that needed to be reactivated, and inactive accounts that required proper documentation and review. By assisting with these requests, we gained further experience in user account management and end-user support.

Later in the morning, Sir Vince assigned us a company-wide inventory task involving employees who had been issued laptops. The objective was to identify and document which laptop users were also assigned to desktop monitors and which were not. Sir Vince explained that the activity would take considerable time because it required visiting multiple departments and interacting with numerous employees. He advised us to take our time and maintain professionalism throughout the process, as communication and proper documentation were just as important as completing the inventory itself.

We began the inventory process at the QA Workstation 1 on the third floor and then proceeded to several departments located in the central office area, including the Process Engineering, Purchasing, Finance, and Planning Departments. We also visited the Workshop 1 Engineering Office, but because the personnel were attending a meeting at the time, we decided to return at a later date to complete the inventory for that area.

In the afternoon, we continued the inventory activity by visiting the Human Resources and Facilities Departments. Throughout the process, we interacted with employees from different levels and departments, allowing us to develop our communication skills and professional confidence. Although the task was physically demanding and time-consuming, it was a valuable experience that taught us the importance of accuracy, organization, and professionalism when managing company assets.

After a short break, we reported our progress to Sir Vince and discussed the results of our inventory work. Since the task required additional time to complete, we agreed to continue the remaining inventory activities the following Tuesday.

While resting after the inventory work, Sir Phomer informed us about an upcoming project involving the preparation of a presentation for employees regarding the transition from local file storage to cloud-based storage solutions through SharePoint. He briefly explained the project's objectives and discussed how we could assist in creating materials to help employees understand the benefits and proper use of the new system. We were excited about the opportunity, as it would allow us to contribute to a company-wide initiative while further developing our presentation and communication skills.

Later in the day, Sir JB (Jose Benito) invited us for an introductory discussion about his role in the organization, like the learning sessions we had previously attended with other members of the Global IT Team. During his session, he introduced us to Identity Management (IDM) and provided a much deeper explanation of its functions and importance within the company.

Although we had already been exposed to IDM-related tasks through our internship activities and previous briefings from Sir Vince, Sir JB's discussion gave us a more comprehensive understanding of the system. As one of the Global IT personnel responsible for managing IDM, he explained how the platform is used to manage employee identities, access permissions, account provisioning, authentication processes, and security controls throughout the organization. He also discussed how IDM contributes to maintaining security, ensuring compliance, and streamlining access management for employees.

Beyond the technical knowledge he shared, Sir JB's approachable and professional personality created an engaging learning environment. His willingness to answer questions and share real-world experiences made the session highly informative and enjoyable.

Overall, this was a productive and meaningful day. Through the company-wide asset inventory activity, we improved our organizational and communication skills while gaining a deeper appreciation for asset management processes. In addition, our discussion with Sir JB expanded our understanding of Identity Management and highlighted the critical role it plays in enterprise security and operations. The combination of practical work and professional mentorship made the day both educational and rewarding.

July 28, 2026 - Day 22

On this day, we became more accustomed to the responsibilities and daily activities of the IT Department while continuing to gain valuable hands-on experience in both technical support and asset management. The day provided us with opportunities to learn more about network administration, interact with employees from different departments, and further develop our communication and troubleshooting skills.

In the morning, we attended our usual daily briefing to discuss the tasks, priorities, and ongoing projects assigned to the team. After the meeting, we were given the opportunity to assist Sir Paul, the Network Specialist, with one of his network-related tasks. He was working on updates and configurations involving connectivity regulations and bandwidth limitations for the PLDT and Globe modems that support the STIHL mobile network. We accompanied him to the server room, where he explained the purpose of the changes and demonstrated how network devices are configured and monitored within an enterprise environment. Through this activity, we gained a deeper understanding of network management and learned more about the responsibilities of a network professional.

After completing this task, we responded to a BitLocker-related concern reported in the Production Department. We assisted in retrieving the necessary recovery information and helped restore access to the affected device. This activity reinforced our understanding of data security and the importance of properly managing encrypted systems in a corporate environment.

Following the BitLocker support task, we continued the company-wide inventory assignment that had been given to us by Sir Vince. The objective was to document laptop users and monitor allocations across different departments. We proceeded to Workshop 3, Workshop 4, and Workshop 5, which are located in separate buildings within the facility.

While conducting the inventory, we encountered several foreign employees and visitors working in these areas. Initially, we felt nervous communicating with people from different backgrounds, but the experience helped us build confidence and improve our professional communication skills. Interacting with a diverse group of employees taught us the importance of clear communication, courtesy, and professionalism in a workplace environment.

By the end of the morning, we had successfully completed the inventory for Workshop 3 and Workshop 5. After lunch, we continued the remaining inventory activities in Workshop 4, ensuring that all assigned devices and monitor allocations were properly documented. The task required careful attention to detail, as accurate records are essential for effective asset management and future IT planning.

Later in the afternoon, we assisted the Quality Assurance (QA) Department with a network connectivity issue affecting their LAN connection. We participated in troubleshooting the problem by checking the network connection, verifying cable and port functionality, and ensuring that the workstation could properly connect to the company network. This task gave us additional practical experience in diagnosing and resolving connectivity-related concerns.

Overall, the day was productive and educational. We gained valuable exposure to network administration through our interaction with Sir Paul, strengthened our understanding of device security through BitLocker support, improved our communication skills while conducting company-wide inventory activities, and further developed our troubleshooting abilities by assisting with network connectivity concerns. These experiences continued to enhance our technical knowledge and prepared us for the diverse responsibilities involved in an IT support role.

July 30, 2026 - Day 23

On this day, we had a productive yet relatively routine workday that allowed us to reflect on how much we have adapted to the corporate work environment. Although the number of tasks assigned to us was not particularly high, the experience helped us recognize the progress we have made in handling daily IT responsibilities and interacting with employees in a professional setting.

In the morning, we attended our usual daily briefing, where the IT team discussed the tasks, priorities, and ongoing projects for the day. Following the meeting, we proceeded with our assigned duties and attended to several support requests from employees.

One of the first concerns we handled involved a BitLocker-related issue in Workshop 2. We assisted in addressing the concern by following the appropriate recovery procedures and ensuring that the affected user could regain access to their device. This task further reinforced our understanding of device security and encryption management within a corporate environment.

Afterward, we received a request from the Purchasing Department regarding printer access. We assisted in configuring the necessary printer settings and ensuring that the user could successfully connect to and utilize the required printing services. Tasks such as these have become familiar to us throughout our internship, and we have grown more confident and efficient in resolving these common IT support concerns.

As we continued working throughout the day, we realized how much we had improved in handling routine IT tasks. What initially seemed unfamiliar during our first few weeks now felt more manageable as we became accustomed to the department's workflow, support procedures, and troubleshooting methods. At the same time, we continued to encounter new situations that challenged us to explore different solutions and expand our technical knowledge.

In addition to addressing support requests, we continued the company-wide device inventory project that had been assigned to us. We visited various departments to verify equipment assignments and update records regarding laptop users and monitor allocations. This ongoing activity required patience, attention to detail, and effective communication with employees across different areas of the company.

During the afternoon, we continued working on the inventory project to further progress toward completing the documentation. The task provided us with additional opportunities to interact with employees and gain a better understanding of how company assets are distributed and managed throughout the organization.

Before the end of the day, we assisted in resolving issues related to Microsoft Teams on several meeting room tablets. The devices were experiencing application-related problems that affected their functionality during meetings. We helped investigate the issue, perform basic troubleshooting, and ensure that the devices were operational for future use.

Overall, the day may have been relatively routine compared to previous days, but it was nonetheless meaningful. It highlighted the progress we have made in adapting to a professional IT environment, strengthening our troubleshooting abilities, and improving our confidence in handling user concerns. Through routine support tasks, inventory management activities, and application troubleshooting, we continued to grow both technically and professionally as IT interns.

July 31, 2026 - Day 24

On this day, we successfully completed multiple tasks and gained valuable hands-on experience in IT support and service management. As usual, we started the day with a morning briefing where the team discussed the assigned tasks, ongoing projects, and priorities for the day. This helped us organize our workload and prepare for the activities ahead.

After the briefing, we visited the Process Engineering Department to address a monitor connectivity issue. We inspected the workstation, checked the display connections, and ensured that the monitor was functioning properly. We also proceeded to Workshop 2 to respond to a user request involving a monitor replacement due to a hardware malfunction. After verifying the issue, we assisted in replacing the defective monitor and confirmed that the new unit was operating correctly.

Throughout the day, we continued working on the company-wide device inventory project while also responding to support tickets submitted by employees. Several requests required hardware-related troubleshooting and equipment verification, allowing us to further develop our technical support skills.

One of the more significant tasks involved diagnosing and repairing a laptop that was experiencing hardware-related issues. While Alexander focused on inspecting and replacing the faulty laptop component, Harvey continued the inventory activity to ensure that progress on the ongoing project was maintained. This division of responsibilities allowed us to manage multiple tasks efficiently and maximize productivity throughout the day.

In the afternoon, we continued with our respective assignments. Harvey proceeded with the remaining inventory checks, while Alexander completed the laptop repair and verified that the device was functioning correctly after the necessary component replacement. Through this

activity, we gained additional experience in hardware maintenance and learned the importance of systematic troubleshooting when resolving device-related concerns.

Later in the day, Sir Vince gave us the opportunity to experience handling actual support tickets within the company's ticketing system. Under his supervision and guidance, we were allowed to process and update support requests while learning the proper procedures for ticket management. This experience was particularly valuable because it gave us firsthand exposure to how professional IT support teams document, track, and resolve user concerns.

In addition, Sir Jeff shared several insights regarding the importance of ticketing systems in modern IT operations. He explained how proper ticket documentation helps monitor workloads, track issue resolution, measure service performance, and maintain accountability within the support process. His discussion helped us understand why ticket management is an essential part of delivering efficient and organized IT services.

Before the end of the day, we also assisted with employee offboarding tasks by removing access privileges for resigning employees. This included updating relevant systems to ensure that former employees were properly removed from authorized access lists and company services as part of the standard clearance process.

Overall, the day was productive, educational, and rewarding. We gained practical experience in hardware troubleshooting, monitor replacement, asset inventory management, ticket handling, and employee access administration. Most importantly, we had the opportunity to work with actual support tickets under the guidance of experienced professionals, giving us a deeper appreciation of the processes and responsibilities involved in providing effective IT support within a corporate environment.

August 03, 2026 – Day 25

On this day, we had a productive yet relatively slow workday, which allowed us to further adapt to the daily routines and responsibilities of the IT Department. As we have become more familiar with our tasks and the department's workflow, we were able to handle our assignments more efficiently and confidently.

In the morning, we attended our usual briefing to discuss the workload, priorities, and scheduled activities for the day. Since Sir Chris was absent due to illness, Sir Vince was responsible for supervising and guiding us throughout the day. After the briefing, we proceeded with our first task, which involved visiting the Security Department to perform the routine maintenance and reset of the turnstile system. This task remains important in ensuring that the access control system continues to operate properly while awaiting a permanent solution to its ongoing hardware-related issues.

After completing the turnstile maintenance, we reviewed the POS (Point-of-Sale) separation list to identify inactive employee accounts that still needed to be removed from the system. This activity was particularly important because accounts that remain active after an employee's separation may continue to receive monthly canteen allowances, which could result in discrepancies during financial and audit reviews. By verifying and updating the records, we helped ensure the accuracy of employee account information and supported proper compliance with company procedures.

Throughout the remainder of the morning, we responded to several employee requests involving computer accessories and peripheral devices. We assisted users in obtaining the necessary equipment and ensured that their concerns were addressed promptly. These tasks allowed us to

continue developing our customer service and asset management skills while supporting employees in their daily work.

In the afternoon, we handled a BitLocker-related concern, assisting a user in regaining access to their device by following the appropriate recovery procedures. This activity further strengthened our understanding of device encryption and security management within a corporate environment. One of the most meaningful parts of the day was the opportunity to have an in-depth conversation with Sir Vince. He shared valuable insights about his career journey, professional experiences, and the lessons he had learned throughout his years in the IT field. He discussed the importance of continuous learning, adaptability, professionalism, and building strong relationships within the workplace. His advice provided us with a better understanding of the realities of working in the IT industry and encouraged us to continue developing both our technical and professional skills.

Overall, the day may have been less busy compared to other workdays, but it was still highly valuable. Through routine support activities, account management tasks, BitLocker assistance, and our discussion with Sir Vince, we gained practical experience and important career insights that will help us grow both as IT professionals and as individuals preparing for future opportunities in the industry.

August 04, 2026 - Day 26

On this day, we had a relatively casual yet productive workday that allowed us to gain new experiences while continuing our regular IT support responsibilities. As usual, we started the morning with a team briefing to discuss the tasks, priorities, and workload for the day. The briefing helped us organize our activities and prepare for the support requests and projects assigned to us.

Throughout the morning, we attended to several employee concerns and support tickets. These included requests for replacement laptop chargers, printer access configuration, and updates to employee records in the Point-of-Sale (POS) system. By handling these tasks, we continued to improve our technical support skills and gained more confidence in addressing common user concerns efficiently.

After completing the initial support requests, we were assigned to assist in identifying and organizing working laptops and unused laptop units that could be prepared for deployment to incoming employees. This activity involved checking device availability, verifying their condition, and ensuring that suitable units would be ready for future distribution. Through this task, we gained a better understanding of asset management and the importance of maintaining accurate records of available IT resources.

Later in the day, we assisted Sir Vince with a local IT infrastructure project involving the planned installation of additional CCTV cameras within the company. Our task was to help map the areas where network cabling would be routed and estimate the total length of Ethernet cables required for the project. This activity introduced us to the planning phase of infrastructure deployment and highlighted the importance of proper measurement and preparation before implementation.

In the afternoon, we continued working on the CCTV project documentation and cable mapping. The task required careful measurement, validation, and multiple rounds of verification to ensure the accuracy of our calculations. We reviewed the planned cable routes, confirmed distances, and performed computations to determine the estimated cable requirements for each camera location.

This process taught us the importance of accuracy in infrastructure planning, as incorrect measurements could lead to material shortages, installation delays, or additional project costs. After completing the cable mapping and verification process, we returned to our regular IT support duties and assisted employees with several remaining concerns before the end of the workday. Overall, the day was both productive and educational. In addition to handling routine IT support requests, we gained valuable experience in asset management and infrastructure planning through our involvement in the CCTV installation project. These activities improved our attention to detail, technical planning skills, and understanding of how IT projects are prepared and executed within a professional corporate environment.

August 05, 2026 - Day 27

On this day, we handled various types of IT support tasks and gained valuable learning experiences from both employee concerns and technical troubleshooting activities. As usual, we started the morning with a team briefing to discuss the tasks, priorities, and workload for the day. The briefing helped us organize our responsibilities and prepare for the support requests that needed to be addressed.

After the meeting, we worked on reimaging several older laptops that were still in working condition and could be prepared for future employee distribution. This process involved reinstalling the operating system, applying the necessary configurations, and ensuring that the devices met company standards before deployment. Through this activity, we continued to enhance our knowledge of device preparation and operating system deployment.

While the reimaging process was ongoing, we also responded to several employee support requests. Many of the concerns were like those we had encountered previously, including printer access configuration and Wi-Fi connectivity issues. By handling these recurring concerns, we became more familiar and efficient with the troubleshooting procedures required to resolve them. In the afternoon, we encountered a more unique and challenging request involving an IT support from Germany. The concern involved changing the BIOS password of several computers used in the Production Department. The request was related to updates being performed on a production monitoring system that required access to specific BIOS settings. Observing and assisting with this task exposed us to another aspect of hardware and system administration that we had not previously encountered during our internship.

Interestingly, we also faced a similar issue with some of the laptops we were reimaging. As a result, we sought assistance from Sir Arvin, who has extensive experience in this area. He guided us through the troubleshooting process and demonstrated how he approaches technical problems, even when the issue is unfamiliar to him. Rather than relying solely on prior knowledge, he emphasized the importance of systematic troubleshooting, research, testing, and logical analysis when resolving technical concerns.

Through Sir Arvin's guidance, we learned valuable lessons about problem-solving and professional growth in the IT field. He showed us that even experienced IT professionals continue to encounter new challenges and that the ability to learn, adapt, and investigate solutions is one of the most important skills an IT specialist can possess.

Overall, the day was both productive and educational. We continued supporting employees through routine IT services, gained additional experience in laptop deployment preparation, and were introduced to BIOS administration and advanced troubleshooting techniques. The

opportunity to learn from Sir Arvin's approach to solving unfamiliar technical issues provided us with valuable insights that will help us become more effective and confident IT professionals in the future.

August 06, 2026 – Day 28

On this day, we had one of the most educational experiences of our internship as we were given the opportunity to learn from professionals specializing in Cybersecurity and Active Directory Administration. As usual, we started the morning with a team briefing to discuss the tasks, priorities, and workload for the day. The briefing helped us organize our responsibilities and prepare for the support requests and activities scheduled throughout the day.

After the briefing, we were given the opportunity to attend an overview session conducted by Sir Marvin, who specializes in Cybersecurity. During this session, he introduced us to the field of cybersecurity and explained its importance in protecting an organization's systems, networks, and data from security threats. He discussed how cybersecurity professionals investigate incidents using multiple layers of analysis and verification to determine the source and impact of security-related events.

Sir Marvin also shared some of the tools and methodologies commonly used in cybersecurity investigations. He explained the importance of monitoring, log analysis, threat detection, and incident response in maintaining a secure IT environment. In addition, he discussed how knowledge in Computer Engineering can be applied in the cybersecurity field and how technical skills, critical thinking, and continuous learning are essential for professionals working in this area. The session gave us a broader understanding of the cybersecurity landscape and inspired us to learn more about this growing specialization within the IT industry.

After the cybersecurity discussion, we returned to our regular responsibilities and resolved several employee support tickets throughout the morning. These tasks allowed us to continue applying our troubleshooting and customer support skills while assisting users with their technical concerns. Later in the day, Sir Hubert provided us with an overview of his role as an Active Directory Administrator. He explained the technical responsibilities involved in managing user accounts, computer accounts, access permissions, organizational units, and group policies within an enterprise environment. Through his discussion, we learned how Active Directory serves as a central component of identity and access management, helping organizations maintain security, consistency, and efficient administration of IT resources.

Sir Hubert also discussed the importance of Active Directory in modern enterprise environments and shared the technical knowledge and skills required to succeed in his role. He explained how proper directory management supports business operations by ensuring that users have the appropriate access to company resources while maintaining security and compliance standards.

In the afternoon, we continued our learning session with Sir Hubert, who not only discussed the technical aspects of his work but also shared his career journey and professional experiences. He provided valuable advice regarding career development, continuous learning, and the importance of building both technical expertise and professional credibility within the IT industry. His insights gave us a better understanding of the opportunities and challenges associated with enterprise system administration.

Towards the end of the day, we resumed our IT support activities and addressed several employee concerns. Among the issues we handled were BIOS password modifications similar to those we

had encountered the previous day. These requests involved assisting with system-level configuration changes required for specific workstations used in critical operational functions. Through these activities, we continued to gain practical experience in hardware and system administration while applying the knowledge we had learned from our mentors.

Overall, this day was highly educational and inspiring. Through the guidance of Sir Marvin and Sir Hubert, we gained valuable insights into the fields of Cybersecurity and Active Directory Administration, two critical areas of modern IT operations. Combined with our regular support activities, the experience broadened our understanding of enterprise IT environments and helped us appreciate the diverse career paths available within the technology industry.

August 07, 2026 - Day 29

On this day, we had a productive and highly educational experience as we continued performing IT support tasks while learning from several professionals specializing in different areas of Information Technology. As usual, we started the morning with a team briefing to discuss the tasks, priorities, and workload for the day, allowing us to organize our responsibilities effectively.

In the morning, we encountered a new network and hardware-related issue involving the Zebra ID card printer used by the Security Department. The printer was experiencing operational problems that prevented it from functioning properly. After conducting basic troubleshooting, we determined that the issue was related to the printer driver. We resolved the problem by installing the appropriate driver and verifying that the printer was operating normally afterward. This task provided us with additional experience in supporting specialized devices commonly used in corporate environments.

After addressing the printer issue, we assisted in bringing newly received Cisco switches to the IT Department for configuration. These switches were to be prepared for future deployment by Sir Paul and Sir JC. While they were performing the configuration process, we took the opportunity to observe their work and ask questions regarding network setup and switch management. Watching experienced network professionals configure enterprise-grade networking equipment gave us valuable insight into real-world networking practices and allowed us to better understand concepts that we had previously encountered only in academic settings.

One of the highlights of the day was the opportunity to attend an overview session conducted by Sir Jeff, who introduced us to his responsibilities involving web systems, domains, and related services. During the discussion, Sir Jeff shared how he manages web-related concerns, handles domain administration, and supports services that are critical to company operations and client requirements. He also explained how issues related to websites and domains are investigated and resolved, as well as the importance of maintaining compliance with company policies, certifications, and industry standards. Through his experiences, we gained a better appreciation of the technical and administrative responsibilities involved in managing web-based services within an organization.

In the afternoon, we attended another highly informative session led by Sir Roed, who specializes in Monitoring Systems and Monitoring Tools Development. Sir Roed explained that his team is responsible for developing and maintaining monitoring solutions used throughout the organization. He introduced us to the purpose and importance of monitoring systems, which help track the status, health, and performance of various applications, servers, and network resources.

During the session, he demonstrated how monitoring tools help different departments identify issues before they affect operations, allowing problems to be addressed proactively rather than reactively. He emphasized that effective monitoring is a critical component of modern IT operations because it helps improve system reliability, reduce downtime, and ensure business continuity. We also learned how these tools are designed and customized according to the specific needs of the organization. Through this discussion, we gained a deeper understanding of how monitoring systems contribute to efficient IT management and support the overall success of the company. The sessions conducted by Sir Jeff and Sir Roed broadened our perspective on specialized IT roles that operate behind the scenes but are essential to maintaining stable, secure, and efficient business operations. Their willingness to share their knowledge and experiences provided us with valuable insight into fields that we had limited exposure to prior to our internship. Overall, the day was both productive and educational. We gained practical experience troubleshooting specialized hardware, observed enterprise network switch configuration activities, and learned about web administration, domain management, and monitoring systems from experienced professionals. These experiences further expanded our technical knowledge and helped us develop a deeper understanding of the many specialized roles that contribute to the success of an IT organization.

August 11, 2026 - Day 30

On this day, we handled a variety of IT support and infrastructure-related tasks, allowing us to gain further experience in both technical support and network operations. As usual, we started the morning with a team briefing to discuss the tasks, priorities, and workload for the day. The briefing helped us organize our responsibilities and prepare for the activities that needed to be completed. One of our major tasks for the day involved assisting with the installation and replacement of new network switches in the server rooms. We helped transport, position, and prepare the switches for deployment while coordinating with the IT personnel responsible for the network infrastructure. This activity gave us valuable exposure to enterprise networking equipment and allowed us to observe how critical network devices are upgraded and integrated into an existing network environment.

After assisting with the switch installation, we attended to several routine IT support requests from employees. These included setting up printer access for users and assisting with account-related configurations. Although these tasks were relatively common, they helped us further improve our troubleshooting, configuration, and customer support skills while ensuring that employees could continue their work without interruption.

In the afternoon, we continued supporting the network upgrade project by assisting with the migration of network connections from the old switches to the newly installed units. This process required careful coordination to ensure that devices and systems remained connected and operational throughout the transition. The upgrade was necessary because the older switches had reached the end of their service life and would no longer receive updates or support. Replacing them with newer equipment would improve network reliability, security, and maintainability for the company.

Through this activity, we gained a better understanding of network infrastructure upgrades and the importance of planning and verification when implementing changes to critical systems. We

also observed how experienced network administrators carefully manage transitions to minimize disruptions to business operations.

Later in the day, we handled several support requests remotely. Using remote support tools, we assisted employees with software and account-related concerns, allowing issues to be resolved more efficiently without the need to physically visit each workstation. This experience reinforced the value of remote support solutions in modern IT operations and helped us become more comfortable using these tools to deliver technical assistance.

Overall, the day was both productive and educational. By participating in the server room switch replacement project, assisting with user support requests, and performing remote troubleshooting, we gained valuable practical experience in network infrastructure management and IT support services. These activities further enhanced our technical skills and provided us with a deeper understanding of the processes involved in maintaining a reliable and efficient IT environment.

August 13, 2026 - Day 31

On this day, we handled a variety of IT support and infrastructure-related tasks, allowing us to gain further experience in both technical support and network operations. As usual, we started the morning with a team briefing to discuss the tasks, priorities, and workload for the day. The briefing helped us organize our responsibilities and prepare for the activities that needed to be completed. One of our major tasks for the day involved assisting with the installation and replacement of new network switches in the IT Office. The upgrade was part of the department's efforts to improve network performance, reliability, and overall productivity. During the installation process, we observed how network infrastructure upgrades are planned and implemented. We also learned the importance of maintaining updated networking equipment to support the growing operational needs of the department.

Since the switch installation was being carried out within the IT Office, we were still able to respond to support requests while assisting with the project. Throughout the day, we handled several tickets and walk-in concerns from employees, including laptop-related issues and other general IT support requests. Balancing project work and end-user support helped us improve our ability to manage multiple responsibilities efficiently.

In the afternoon, after completing the switch installation activities, we were given the opportunity to attend a learning session conducted by Sir Lawrence, who serves as an SAP Basis Administrator. During his presentation, he explained the role of SAP Basis in managing and maintaining SAP environments used by the company. He discussed the responsibilities involved in ensuring system availability, monitoring performance, system administration, and supporting the applications that many business processes rely on. Sir Lawrence emphasized the importance of SAP Basis administration in maintaining the stability and efficiency of enterprise operations. His discussion also gave us a broader understanding of how large-scale business systems are managed behind the scenes and the critical role administrators play in keeping them operational.

Following Sir Lawrence's session, Sir Rodel provided us with an overview of Backup and Storage Management. Although he described his role in a straightforward manner, his discussion helped us realize how vital backup and storage management is to the organization. He explained how his team is responsible for safeguarding the company's critical data by ensuring that backup systems are functioning properly and that important information can be recovered when needed.

Sir Rodel also discussed the importance of data retention, storage planning, and disaster recovery strategies. Through his explanation, we learned that while backup and storage management may not always be visible to most employees, it plays a crucial role in protecting business operations from data loss, hardware failures, and unexpected incidents. His passion and enthusiasm for the field helped us appreciate how essential these responsibilities are in maintaining the security and continuity of the company's information systems.

Overall, the day was both productive and highly educational. We gained practical experience in network infrastructure upgrades while continuing to support employees with their IT concerns. In addition, the learning sessions conducted by Sir Lawrence and Sir Rodel expanded our understanding of enterprise systems, SAP administration, backup solutions, and storage management. These experiences provided us with a deeper appreciation of the specialized roles within the IT industry and highlighted the importance of the different teams that work together to support the company's operations.

August 14, 2026 - Day 32

On this day, we had a productive and highly educational experience as we continued performing IT support tasks while learning from professionals specializing in different areas of Information Technology. As usual, we started the morning with a team briefing to discuss the tasks, priorities, and workload for the day. This allowed us to organize our responsibilities effectively and prepare for the support requests assigned to us.

After the briefing, we handled several technical support tasks. One of the main activities involved diagnosing and documenting an issue reported by an employee regarding a company-issued laptop. The documentation process was particularly important because it was required by the laptop manufacturer's warranty support team. We carefully gathered the necessary information, identified the symptoms of the issue, and prepared the required documentation to assist in the warranty claim and maintenance process. Through this activity, we learned the importance of proper documentation in technical support, as accurate records can significantly speed up troubleshooting, repairs, and warranty-related transactions.

While conducting the documentation process, we also worked on reimaging several laptops that were scheduled for deployment to newly hired employees. This involved reinstalling the operating system, applying necessary configurations, and ensuring that the devices complied with company standards before being distributed. These tasks continued to strengthen our understanding of device preparation and deployment procedures within a corporate environment.

In the afternoon, we were given the opportunity to attend an overview session conducted by Sir Alvin, who specializes in Microsoft Collaboration Services. During the discussion, Sir Alvin explained the importance of collaboration platforms within modern organizations and how they help employees communicate and work efficiently across different departments and locations. He introduced us to the responsibilities of his role, which include managing Microsoft accounts, granting access permissions, and administering various Microsoft applications and services used throughout the company.

Sir Alvin emphasized that although the tasks involved in Microsoft Collaboration management may appear straightforward, they are essential to ensuring seamless communication, productivity, and access to business resources. Through his explanation, we gained a better understanding of how enterprise collaboration tools support daily operations and contribute to organizational efficiency.

After Sir Alvin's presentation, we assisted Sir Arvin with a task involving file configuration and system settings for one of the company's devices. During this activity, he explained the purpose of the configuration changes and demonstrated the proper procedures for managing and maintaining device settings. This gave us additional hands-on exposure to system administration tasks and allowed us to observe how experienced IT professionals approach technical configurations and troubleshooting.

Overall, the day was both productive and educational. We gained valuable experience in technical documentation, warranty support procedures, laptop deployment, Microsoft collaboration services, and system configuration management. The combination of practical support tasks and learning sessions further expanded our technical knowledge and strengthened our understanding of the diverse responsibilities performed by IT professionals within the organization.

August 18, 2026 - Day 33

On this day, I worked independently as my fellow intern, Harvey, was on sick leave. Despite being the only intern present, the day was productive and allowed me to gain valuable experience in network infrastructure, hardware troubleshooting, and user support. As usual, the day began with a team briefing to discuss the tasks, priorities, and workload for the day. This helped me organize my responsibilities and prepare for the various support requests and activities that needed to be completed.

One of my major tasks for the day involved assisting with the installation of a new network switch for Workshop 3. Before the installation, I prepared the switch and assisted Sir Chris in connecting and registering the device within the IDM environment. This preparation was necessary to ensure that the switch could be properly integrated into the company's network infrastructure before its deployment. The experience allowed me to observe the preliminary steps involved in implementing networking equipment in a production environment.

While the switch was being prepared, I also handled several employee support concerns. One of these involved providing a replacement monitor for an employee whose existing monitor was causing discomfort due to poor display quality and excessive blue light exposure. By addressing this concern, I helped improve the employee's workstation setup and overall user experience.

Later in the morning, I accompanied Sir Vince to one of the Engineering offices to troubleshoot a laptop issue reported by an employee. After assessing the problem, Sir Vince determined that replacing the laptop's RAM would be the most appropriate initial solution. I retrieved a compatible RAM module from another laptop of the same model that was no longer being used due to other hardware issues. After installing the replacement RAM, the laptop functioned normally again, successfully resolving the issue. This task provided me with valuable hands-on experience in hardware diagnosis and component replacement.

Since we had an early lunch schedule, I later joined Sir Chris and Sir Vince in Workshop 3 to complete the switch installation. We connected the necessary Ethernet and fiber-optic cables and prepared the device for operation. However, after the installation was completed, the new switch did not function as expected. After further assessment, Sir Paul suggested that the issue was likely related to the switch configuration rather than the hardware itself. Since additional troubleshooting and configuration adjustments were required, the team decided to investigate the problem further later in the week.

To ensure that employees in Workshop 3 would not experience network downtime, Sir Paul instructed us to reconnect the existing network connections to the old switch. We promptly restored the previous setup, allowing users to continue accessing network resources and the internet without interruption. This experience taught me the importance of contingency planning and minimizing operational disruptions during infrastructure upgrades.

In the afternoon, I continued assisting employees with various support requests, including electronic signature (e-sign) configuration and printer access setup. These tasks helped maintain business continuity by ensuring that employees could access the tools and services necessary for their daily work.

Before the end of the day, I also continued working on the configuration and system settings task that Sir Arvin had assigned the previous Friday. This activity allowed me to further familiarize myself with system administration procedures and device configuration practices used within the company.

Overall, the day was both productive and educational. Working independently gave me the opportunity to take on more responsibility while strengthening my technical and problem-solving skills. Through network switch deployment, hardware troubleshooting, infrastructure maintenance, and user support activities, I gained valuable practical experience and a deeper understanding of the daily responsibilities of an IT professional.

August 19, 2026 - Day 34

On this day, we handled a variety of IT support and infrastructure-related tasks, allowing us to gain further experience in both technical support and network operations. As usual, we started the morning with a team briefing to discuss the tasks, priorities, and workload for the day. The briefing helped us organize our responsibilities and prepare for the activities that needed to be completed. In the morning, we responded to several support tickets involving printer access issues and laptop hardware replacements. Many of the printer-related concerns involved configuring user access, checking connectivity, and ensuring that the devices were properly connected to the network. Compared to when we first started our internship, these tasks felt much more manageable because we had already gained significant experience in troubleshooting and resolving similar issues. This made us realize how much our technical skills and confidence had improved throughout our training.

We also assisted with replacing faulty laptop components for several devices that required maintenance. Through these activities, we continued to develop our hardware troubleshooting skills and became more familiar with identifying and resolving common device-related issues. Tasks that initially seemed complex now felt more straightforward because of the knowledge and experience we had accumulated over the previous weeks.

Later in the morning, we were assigned to help prepare for the ongoing network infrastructure upgrade project. Our task was to label and document the Ethernet connections connected to the older Cisco switches. Proper labeling would help simplify the migration process when the old switches are eventually replaced with newer models. This activity emphasized the importance of organization and accurate documentation in network management, as properly labeled connections reduce errors, minimize downtime, and make future maintenance activities more efficient.

In the afternoon, we assisted with the deployment of a new printer that was to be installed in the office of the President's Secretary. The printer had been prepared and configured by Sir Chris over the previous few days, and our role was to help transfer and set up the device in its designated location. After installation, we verified that the printer was functioning properly and ready for use. Following the printer deployment, we continued addressing support tickets submitted by employees. Most of the concerns raised throughout the afternoon were related to printer access, connectivity, and configuration issues. By this stage of our internship, handling printer-related concerns had become one of the tasks we were most familiar with, allowing us to resolve issues more efficiently while continuing to provide quality support to employees.

Overall, the day was productive and rewarding. Through hardware maintenance, network documentation, printer deployment, and user support activities, we continued to strengthen our technical abilities and gain confidence in our role as IT interns. The experience also highlighted how much we have grown since the beginning of our internship, as many of the tasks that were once unfamiliar have now become part of our regular workflow and professional development.

August 20, 2026 - Day 35
